-----

The double-column bracket, also known as the T-shaped bracket, consists of two columns perpendicular to the ground and a beam. This design significantly enhances structural stability.

Double column photovoltaic brackets have emerged as the go-to solution for high-wind regions - but what makes them 25% more reliable than single-post alternatives? Let's break down the critical factors.

In order to respond to the national goal of "carbon neutralization" and make more rational and effective use of photovoltaic resources, combined with the actual photovoltaic substation project, a fixed ...

Various double column solutions, can be used with different materials and foundations, good structural stability, high degree of factory pre-assembly, can be quickly installed.

It is the main installation component for photovoltaic modules and a relatively important accessory installed between the photovoltaic panels and the bracket. It not only supports the ...

As the sun sets on outdated mounting methods, one thing's clear--ground double column photovoltaic brackets aren't just supporting panels, they're elevating the entire solar industry.

The Leon solar Double-column Carbon Steel PV System is a ground-mounted solar photovoltaic support structure designed for efficient and stable solar power generation.

This kind of bracket can reduce the amount of land construction and is suitable for areas with complicated terrain. Double-column bracket adopts the form of front and rear columns.

The double-column bracket is suitable for larger photovoltaic power station systems. Its structure is more stable and can withstand greater wind force and weight.
