What is a data center rack?

Data center racks are metal frames used for organizing IT equipment such as servers and switches. Cabinets are enclosed racks that offer added security and environmental control. Cages are secure areas within a data center that house multiple racks or cabinets, providing an extra layer of security.

What are racks & cabinets in a data center?

In a data center, racks, cabinets, and cages serve to organize, protect, and manage servers and IT hardware. Additionally, they facilitate cable management and airflow for proper cooling of this hardware. Each feature can be differentiated as follows:

Where are servers and networking equipment located in a data center?

Inside a data center, servers and networking equipment are securely housed in racks, cabinets, and cages. Because racks and cabinets are often the first pieces of equipment that organizations install, it is crucial to make informed choices to ensure optimal performance.

Are enclosed racks a good choice for a data center?

This makes them well-suited for transportation or for use in unstable environments. Enclosed racks are ideal for high-density data centers and server rooms, as they are designed to accommodate heavier and hotter equipment, as well as higher wattages per rack.
