US wind installations will rebound in 2025, but the concern lies in the sharply downgraded 5-year outlook. We'll give you one guess why.

The wind energy industry has been on an exponential growth curve for more than a decade. POWER looks at the drivers behind the growth and predictions for the future.

Despite a 7% decline in wind power production in early April compared to the same period in 2024--primarily due to weaker wind speeds in regions like Texas--the overall contribution of wind ...

In our latest Short-Term Energy Outlook, we forecast that wind and solar energy will lead growth in U.S. power generation for the next two years.

See the projected growth of the wind industry over the next 35 years. All units are in gigawatts (GW). Only states with total capacity over 0.1 GW are included per year. Find out more about the data by ...

As a result of new solar projects coming on line this year, we forecast that U.S. solar power generation will grow 75% from 163 billion kilowatthours (kWh) in 2023 to 286 billion kWh in ...

Wind farms have generated a record share of U.S. electricity production so far in 2024, and are the second largest source of clean power behind nuclear plants in the U.S. generation system.

Utility-scale solar's share of total installed capacity of (11.42%) is now almost equal to that of wind (11.81%). Taken together, they constitute nearly one-fourth (23.23%) of the U.S.'s total ...

Solar and wind accounted for 91% of new US electrical generating capacity added in H1 2025, according to data just released by FERC.

Is the probability of wind power generation high now

Current installed wind generation capacity in the U.S. is roughly 152 gigawatts (GW), according to the U.S. Energy Information Administration (EIA). That capacity is up 46% from 2019, ...
