After deployment, the controllers can control live microgrids via their communication systems and can be fine-tuned and re-deployed instantly without any decommissioning.

The control system must regulate the system outputs, e.g. frequency and voltage, distribute the load among Microgrid (MG) units, and optimize operating costs while ensuring smooth transitions between operating ...

In addition to system modeling and control design, you can evaluate the interoperability of microgrid with utility grid, perform load forecasting to reduce uncertainty in demand planning, and implement control strategies ...

A load-frequency control (LFC) model for an islanded microgrid is examined, comprising of a solar photovoltaic system, wind turbine, tidal turbine and a diesel engine generator.

Recent studies have explored a variety of optimization strategies for microgrid operations, especially under uncertainty due to renewable energy variability, price fluctuations and load dynamics. ...

Turnkey microgrid control solutions include electrical system protection, cybersecurity, real-time controls, integration with existing infrastructure, and more.

NLR develops and evaluates microgrid controls at multiple time scales. Our researchers evaluate in-house-developed controls and partner-developed microgrid components using software modeling and ...

In this study, a demand-contributed load frequency control (LFC) strategy is proposed for frequency stabilization in a solar-wind-based autonomous microgrid system (AMGS).
