To assess these two distinct levels of uncertainty in the contexts of microgrids connected mode, we propose a new stochastic (two-stage) Stackelberg model with a chance constraint to ...

This paper presents a novel multi-objective stochastic optimization model for the optimal operation of a coalition of interconnected smart microgrids, integrating renewable energy resources...

The uncertainties associated with the generation of renewable energy sources (RESs), accompanied by the randomness of unscheduled islanding events and failures occurring in a microgrid, have made it ...

In this study, the stochastic energy management, and scheduling of a renewable microgrid involving energy sources and dynamic storage is performed considering energy resource and demand ...

However, due to the intermittency of wind, the uncertainty of wind power generation posed significant challenges for microgrid scheduling. Therefore, this paper proposed a robust optimization ...

In this paper, we investigate the key features of microgrids and provide a comprehensive literature survey on the stochastic modeling and optimization tools for a microgrid.

In this work, we consider a microgrid, as shown in Fig. 1.1, equipped with photovoltaic panels to locally produce electricity to satisfy the building's demand.

olves as a promising solution to in-tegrate and manage distributed renewable energy resources. In this paper, we establish a stochastic multi-objective sizing optimization (SMOSO) model for microgrid ...

Abstract: This paper presents a Two Stage stochastic Programming (TSSP) model for the planning of Multi-Microgrids (MMGs) in Active Distribution Networks (ADNs).

To address the question of how to best achieve a tradeoff, this work proposes the use of a two-stage stochastic decision-making approach for designing and operating an MMG considering ...
