How does adjusting a solar panel's angle affect energy production?

Adjusting your solar panel's angle impacts your energy collection. For instance, with a system at 40° latitude, see the comparison in the table below to the optimal tracker, which always faces the sun directly. Adjusting the tilt twice a year gives your energy production a solid boost.

What angle should a solar panel be?

If you don't adjust your panels with the seasons, pick an angle that works best throughout the year for your location. The season and where you live are important considerations for finding the right angle. Los Angeles, CA, with a latitude around 34 degrees north, suggests a solar panel angle of approximately 34 degrees.

How do I adjust the angle of my panels?

You can adjust the tilt from 20° to 50°, depending on your panel size, and numerous holes enable seasonal angle changes. With our adjustable triangles, you can adjust the panel angles on-site to avoid shadows and make the most of your space for even more panels. If you're putting them on the ground, you don't need a big foundation.

How do I adjust the tilt of my solar panels?

For winter, take the latitude, multiply by 0.89, and add 24 degrees. If your latitude is outside this range, see Other Situations below. If you want to adjust the tilt of your panels four times a year, you can use these figures to keep capturing the most energy year-round. This table gives some examples:
