To fully grasp the role of solar energy in sustainable shipping and ports, it is important to define the key concepts involved. Sustainable shipping and ports refer to practices and infrastructure ...

An array of panels will be used to directly power an inland cargo vessel's propulsion systems, allowing a diesel generator to be switched off and even "solar sailing" when travelling ...

While earlier projects like the MS Helios utilized solar panels exclusively for low-voltage onboard systems, the Blue Marlin features a fully integrated system that connects solar energy ...

The basic principle of solar photovoltaic power generation is to charge the battery through the controller under sunlight or directly supply power to the load under the condition of satisfying the load demand.

According to the study's results, integrated solar PV systems could reduce crew workload, enhance safety, increase ship energy range, and influence the design of new types of ...

The responses show that the integration of the ship power system with the hybrid energy storage system stores and utilises the excess solar energy which reduces the dependence on bunker fuel.

Sun et al. proposed the basic principle of applying solar PV system to ship integrated power grid by analyzing the technical characteristics of off-grid and grid-connected ship PV systems.

The panels will supply energy to the onboard and propulsion systems, making the Blue Marlin the first inland shipping vessel to rely directly on solar power for sailing operations.

With the further development of solar photovoltaic technology, the utilization of solar energy will be one of the key measures to realize green navigation for ships in the future.

Principle of solar power generation for inland ships

This paper will review several studies and applications of solar energy as part of ship power system, and analyze the contributions in supporting reduction of carbon emissions.
