What is the minimum LCOE for a 31.5 kW solar system?

For a system with 31.5 kW e scale, the minimum LCOE of 217.8 USD/MWhe with 87.24% CF occurs at 2.55 solar multiple and 16.08 storage hours. The optimum design parameters are a result of balancing capital costs with annual electricity generation for minimum LCOE.

What is an example of a small-scale CSP system?

The Infinia dish concept (dish-Stirling with integrated phase change material storage) is another example of a prototype small-scale CSP system. Low cost small-scale storage options such as those with molten glass and graphite have also been examined.

What happens if solar storage is undersized?

An undersized storage would lead to curtailment of solar energy provided by the collector-receiver due to the storage being full, and consequently a less-than-optimal amount of electricity being generated throughout the year.

How much LCOE does a solar plant need?

The parametric sweep indicates a minimal LCOE in the region of solar multiple of 2.3-2.9 with approximately 14-20 h of storage. In order to obtain precise optimal plant design parameters and show the trade-off between LCOE and CF, a multi-objective optimisation routine is implemented. Fig. 7.
