Hi there, is it possible to set an upper SOC limit (i.e. 80% or 90%) for an off-grid PV system through the Cerbo GX or using VE nfig? (in order to extend lithium battery life).

BMS shut off voltages can be set by design and/or software. The BMS in a good battery should shut down long before their battery damage or insufficient voltage to recharge the battery with ...

Ensure that the state-of-charge (SoC) limits are correctly set. For instance, if an installer set the battery to reserve 20% for longevity, it will never charge above 80% or discharge below 20%.

Setting the wrong daily SOC limits for backup is a frequent error that can lead to premature battery degradation and a system that fails when you need it most. This article outlines ...

Learn what SOC (State of Charge) means in a solar system, how battery SOC impacts performance, and how to monitor the state of charge of the battery for better efficiency and lifespan.

Discover how proper SOC (State of Charge) limit settings enhance battery lifespan and system efficiency in renewable energy storage. Learn industry best practices, real-world case studies, and ...

There is a Max SoC setting but it only applies to charging from the grid, if there is enough solar PV available the battery will charge to 100% from it. There"s two MinSoC settings, as you might ...

SoC Setting set the highest value where PV and AC can charge to and to lowest value where the output deliver energy. The SoC for the lowest value just cut off the power, so ...

During periods of poor weather when solar energy is reduced, BatteryLife will dynamically raise the Low SoC limit which has been set. This has the effect of making less power available for consumption.

The idea is to maximize battery life by charging everyday to 90% (or set a equivalent charge voltage limit),

Solar container battery soc limit setting

and once a month do a full charge to let the BMS balance the cells.
