What is a diversion dam?

Diversion dams are engineered structures that elevate the water level of rivers or other water bodies to redirect flow for various purposes. This redirected water can supply irrigation systems, reservoirs, and hydroelectric power generation facilities. Additionally, it can be utilized for industrial applications and municipal water supply.

What is a diversion hydro system?

A diversion hydro system is also called a run of river hydro system because flows are not managed, water is not stored. Therefore the amount of electricity generated can also vary widely. Terms like weir and penstock got you confused? We'll help you understand these as well and how a diversion hydro site works.

How do diversion facilities work?

Diversion facilities, or run-of-the-river systems, redirect part of a river's flow through a pipe called a penstock or a canal to a powerhouse where it drives a turbine, generating electricity. These facilities control water flow through gates and valves, ensuring efficiency.

What is a diversion system?

A diversion, also known as a "run-of-river" facility, is a system that channels part of a river through a canal or penstock to harness the natural decline in elevation for energy production. The penstock is a closed pipe that directs water flow to turbines, regulated by gates and valves.

The Department of Energy's diversion or run-of-the-river facility is the most dependent on weather conditions or river flow, as it lacks water storage capacity. Different types of hydroelectric ...
