-----

This graph plots actual system-wide wind and solar generation, which is impacted by curtailment, shown as "Wind Gen Hourly Avg", "Solar Gen Hourly Avg" and "Combined Gen Hourly Avg". Because of ...

The repository (called PLUSWIND) is publicly available and contains hourly wind speed and generation estimates covering 2018 - 2021 for existing wind plants located within the contiguous ...

Global onshore and offshore wind generation potential at 90m turbine hub heights could provide 872,000 TWh of electricity annually, 9 over 30 times the 27,081 TWh used globally in 2023. 10 Continental ...

The Alta Wind Energy Center in California, with over 1.5 GW of power, shows how much commercial wind turbine output per hour can be. These huge setups are made to get the most hourly ...

This report is posted every hour and includes system-wide and regional STPPF and PVGRPP values produced by each forecast model for On-Line PVGRs for the rolling future 168-hour ...

Looking for archive data?

The repository contains wind speeds and generation based on three different meteorological models: ERA5, MERRA2, and HRRR. Data are publicly accessible in simple csv files.

The PLUSWIND repository provides a unified set of hourly wind speed and generation estimates based on information from three meteorological models; from multiple sources of data about operational ...

In other words, while wind turbines typically generate electricity during most hours of the day, they produce a varying percentage of the nameplate capacity in any given hour. Capacity factor ...

A typical modern wind turbine can generate anywhere from 0.5 to 5 megawatts (MW) of power per hour, but the actual amount varies considerably depending on factors like turbine size, ...
